AEGIS / Executive tear sheet

Quantum-X | Serendib University Endowment | USD 10 million

Data as of 2026-09-30. Proposal: ADJUST, pending independent team approval.

Horizon: 10+ years. Provisional objective: 4% nominal total return before spending; assumed inflation 2.5%. A payout/income budget remains to be agreed.

Proposed holding	Weight	Dollar allocation
SPY	11.73%	$1,173,301
AGG	70.00%	$7,000,000
GLD	10.00%	$1,000,000
XLK	8.27%	$826,699

Held-out net KPI	Value	Latest daily risk99	% NAV / USD
CAGR	9.99%	Historical VaR	1.11% / $111,477
Volatility	6.64%	Historical ES	1.31% / $131,011
Maximum drawdown	6.12%	EVT ES	1.27% / $127,098

Capital at risk: worst historical replay drawdown 17.52%; hypothetical squeeze loss 15.23% ($1,522,670). These exceed the proposed 15% tolerance and are not bounds on future loss.

Validation: historical VaR99 has 8/939 exceptions; Kupiec p=0.640, independence p=0.711. The last 250 forecasts are green; non-rejection is not a guarantee.

Committee action: resolve the crisis-risk limit and spending assumptions before funding. Retain the minimum-variance candidate for review; require a revised eligible allocation or reject if the agreed tolerance cannot be met.

Assumptions: daily target rebalancing, 10bp per dollar traded for net KPIs; gross one-day risk and stress P&L; finite historical sample; Gaussian and EVT model uncertainty. Gold generates no contractual income. All recommendations remain AI-assisted proposals.
